

The JavaScript

Searching the user agent string for "Android" is the quickest method:

```
var ua = navigator.userAgent.toLowerCase();
var isAndroid = ua.indexOf("android") > -1; //&& ua.indexOf("mobile");
if(isAndroid) {
    // Do something!
    // Redirect to Android-site?
    window.location = 'http://android.davidwalsh.name';
}
```

The PHP

Again, we'll use PHP's strstr function to search for Android in the user agent:

```
$ua = strtolower($_SERVER['HTTP_USER_AGENT']);
if(strpos($ua, 'android') !== false) { // && strpos($ua, 'mobile') !== false) {
    header('Location: http://android.davidwalsh.name');
    exit();
}
```

Bonus! .htaccess Detection

We can even use .htaccess directives to detect and react to Android devices!

```
RewriteCond %{HTTP_USER_AGENT} ^.*Android.*$
RewriteRule ^(.*)$ http://android.davidwalsh.name [R=301]
```
